CE - Regression Analysis

==========

Regression Interpretation - CE

==========

Slope (beta1): 0.5427

R-squared: 0.3445

Interpretation:

Strong positive effect: higher ad evaluation -> higher purchase intention.

Moderate predictive power (R2 = 0.34).

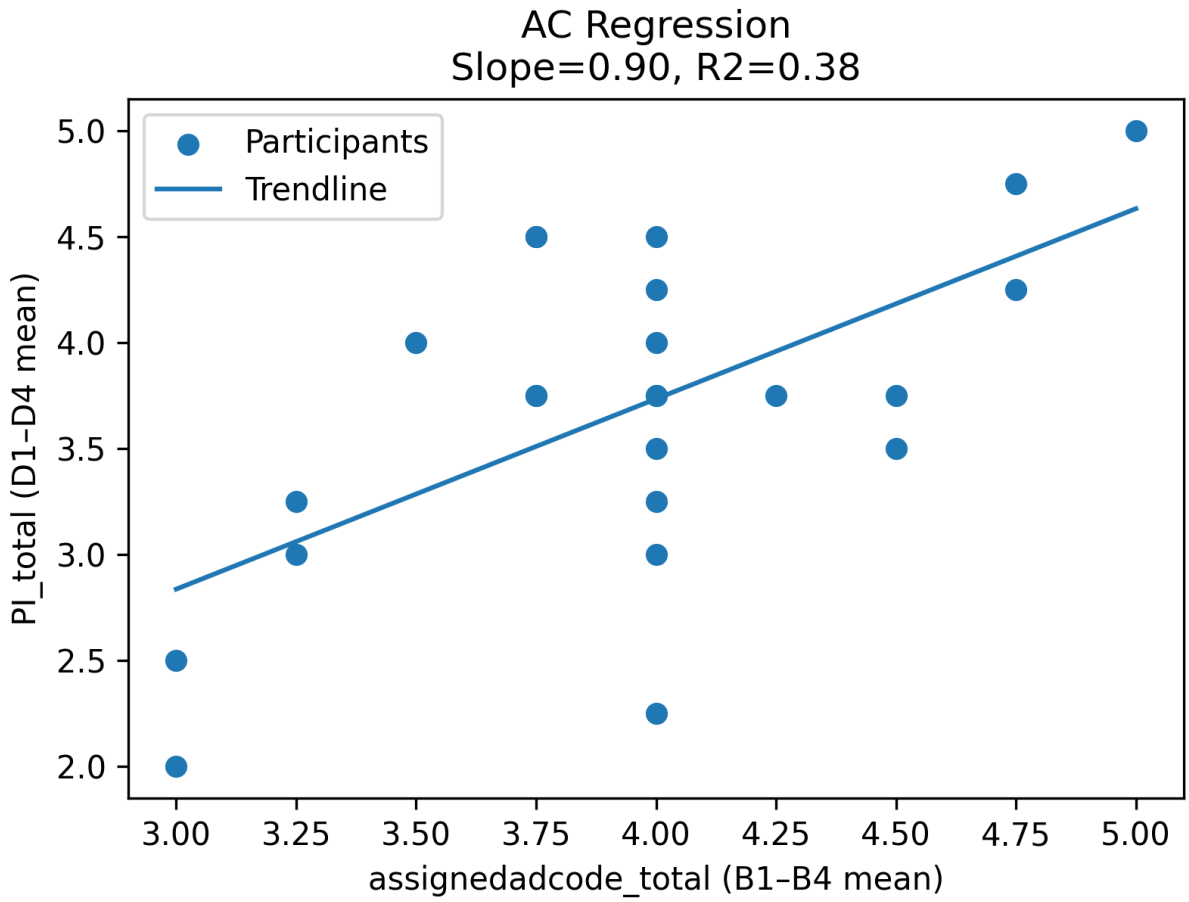

Overall Meaning:

A 1-point increase in ad evaluation (B1-B4)

results in a 0.54-point change in PI_total (D1-D4).

The model explains 34.4% of the variance in purchase intention for CE.

AC - Regression Analysis

==========

Regression Interpretation - AC

==========

Slope (beta1): 0.8979

R-squared: 0.3757

Interpretation:

Strong positive effect: higher ad evaluation -> higher purchase intention.

Moderate predictive power (R2 = 0.38).

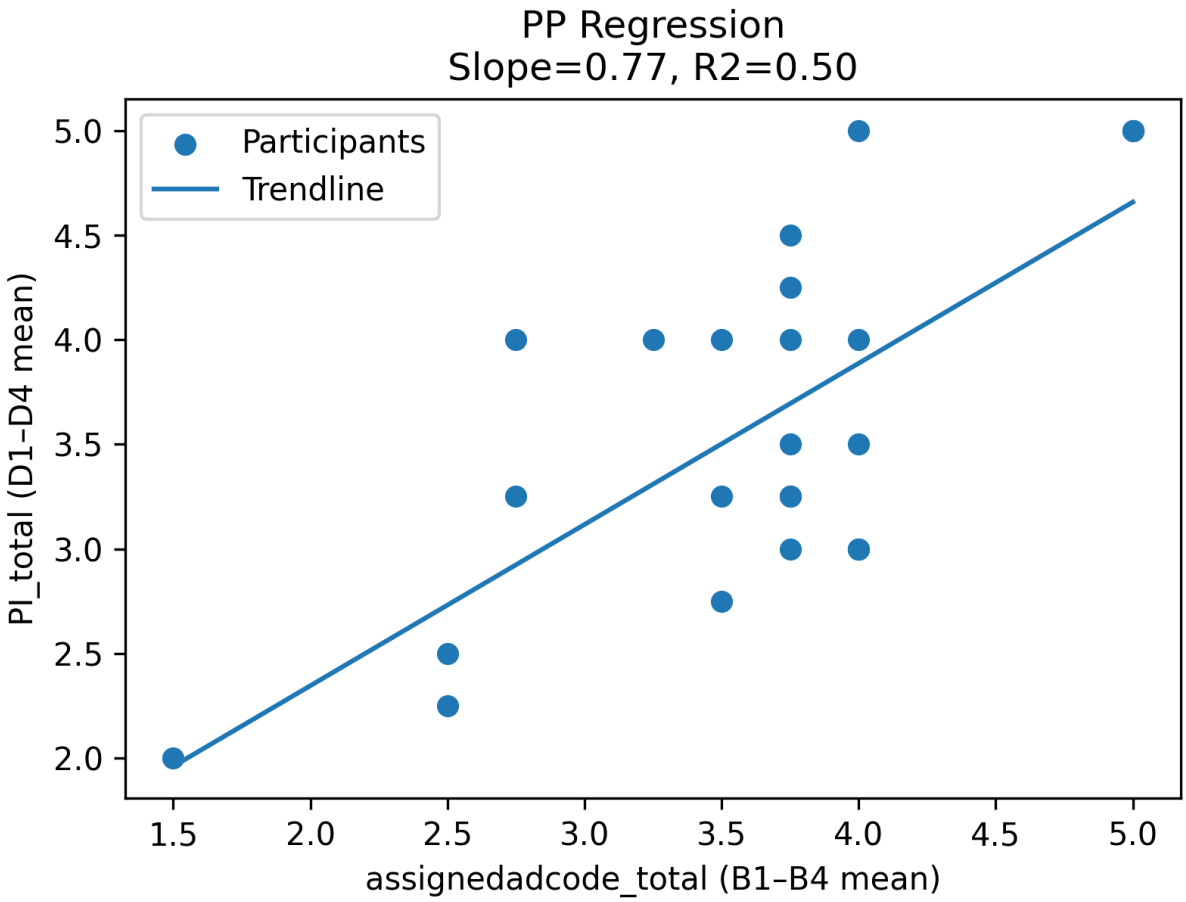

Overall Meaning:

A 1-point increase in ad evaluation (B1-B4)

results in a 0.90-point change in PI_total (D1-D4).

The model explains 37.6% of the variance in purchase intention for AC.

PP - Regression Analysis

==========

Regression Interpretation - PP

==========

Slope (beta1): 0.7712

R-squared: 0.5046

Interpretation:

Strong positive effect: higher ad evaluation -> higher purchase intention.

Strong predictive power (R2 = 0.50).

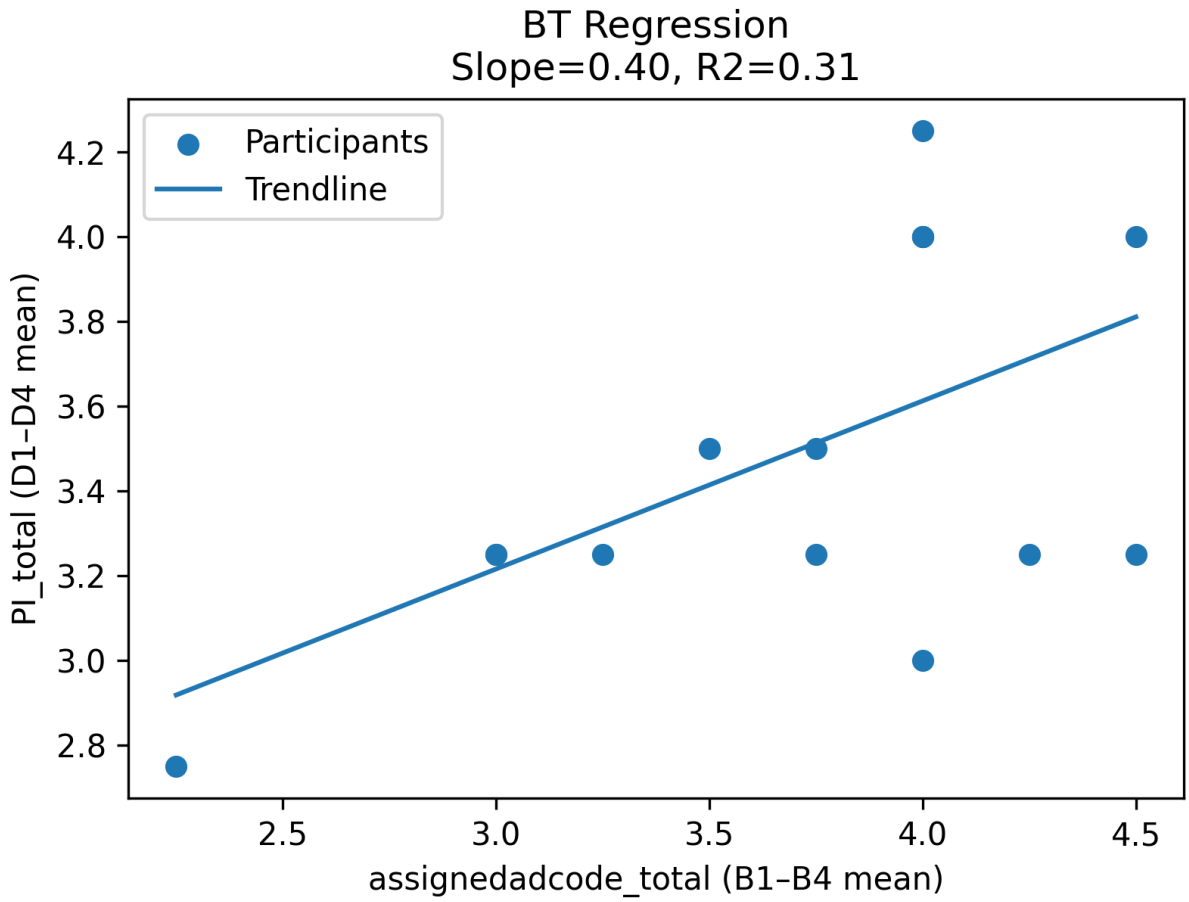

Overall Meaning:

A 1-point increase in ad evaluation (B1-B4)

results in a 0.77-point change in PI_total (D1-D4).

The model explains 50.5% of the variance in purchase intention for PP.

BT - Regression Analysis

==========

Regression Interpretation - BT

==========

Slope (beta1): 0.3966

R-squared: 0.3064

Interpretation:

Moderate positive effect: higher ad evaluation -> higher purchase intention.

Moderate predictive power (R2 = 0.31).

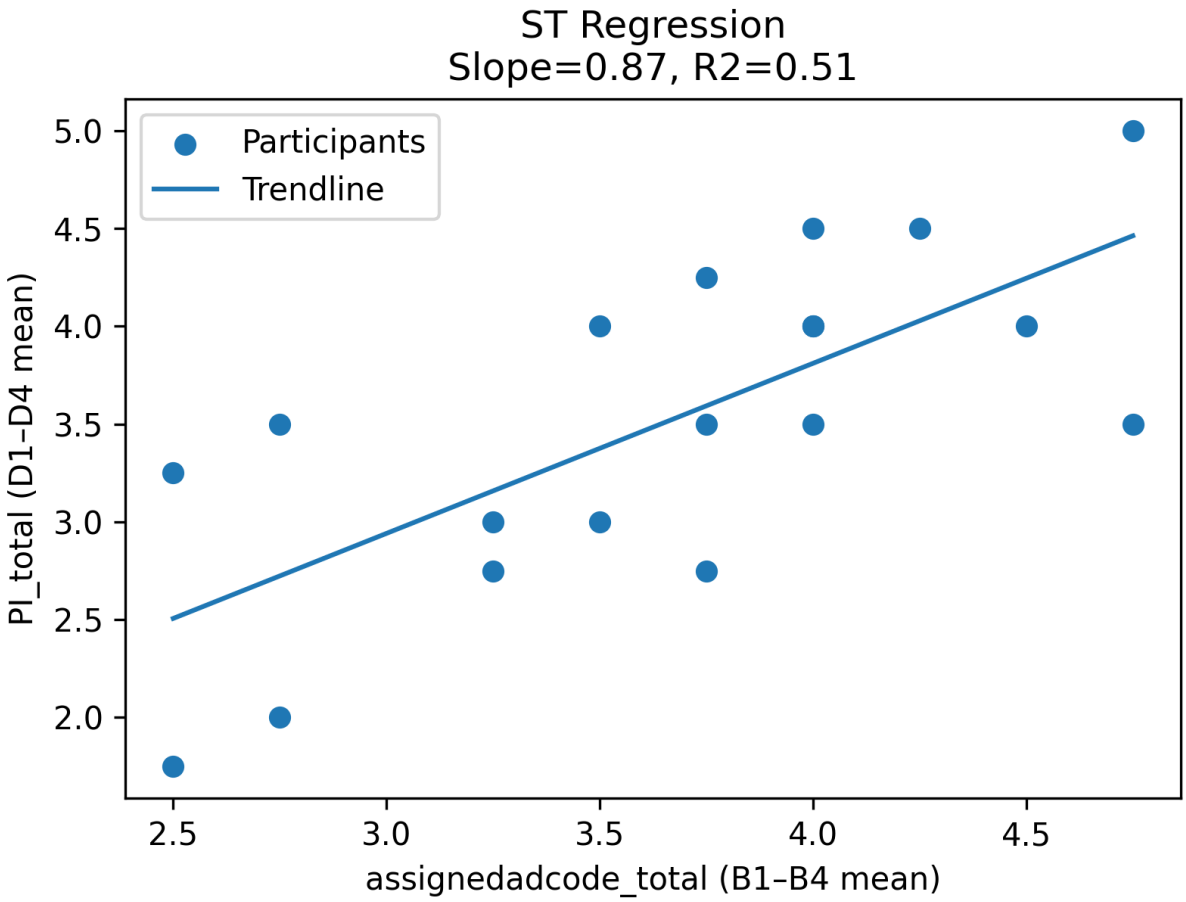

Overall Meaning:

A 1-point increase in ad evaluation (B1-B4)

results in a 0.40-point change in PI_total (D1-D4).

The model explains 30.6% of the variance in purchase intention for BT.

ST - Regression Analysis

==========

Regression Interpretation - ST

==========

Slope (beta1): 0.8696

R-squared: 0.5107

Interpretation:

Strong positive effect: higher ad evaluation -> higher purchase intention.

Strong predictive power (R2 = 0.51).

Overall Meaning:

A 1-point increase in ad evaluation (B1-B4)

results in a 0.87-point change in PI_total (D1-D4).

The model explains 51.1% of the variance in purchase intention for ST.
